ACCOUNTING &

BACK-OFFICE AUTOMATION

AI-Driven Accounting, Insurance Compliance,
and Administrative Operations for a Scaling GC

CONFIDENTIAL

Six Peak Capital | LV Construction

Supporting Document to AI Mission Control Business Plan

March 2026

1. Executive Summary

The AI Mission Control business plan focuses on field operations, scheduling, quality control, and document intelligence—the construction-facing functions where Grady's institutional knowledge lives. But accounting and back-office operations are not a separate workstream—they are an integral part of the Mission Control platform, mapped and automated in lockstep with field operations during the same audit and build phases. As LV Construction scales from $45M to $190M in revenue across 8–12 simultaneous projects, every accounting workflow—AP/AR processing, job cost reconciliation, WIP reporting, lender draws, certified payroll, retention tracking, insurance compliance—must scale with it. The existing finance team (CFO at $250K, Controller at $150K) provides the domain expertise; Mission Control provides the automation layer that lets that team handle 3x the project volume without adding headcount.

This paper maps the complete accounting and administrative operations of a GC at LV Construction's scale, identifies every AI automation opportunity, and details how each workflow integrates into the Mission Control platform during the standard sprint sequence. It also addresses a critical risk management gap: subcontractor insurance certificate (COI) collection, monitoring, and compliance—a workflow that represents an existential liability exposure if a lapse goes undetected.

The central thesis: accounting automation is not a Phase 2 add-on. It is built into the Mission Control platform from Sprint 1. The Construction-AI Translator maps accounting workflows alongside field workflows during the same observation period. The same data warehouse, the same API integrations, and the same document intelligence module serve both operational and financial functions. The CFO and Controller participate in the mapping process as primary stakeholders, ensuring the system reflects how LV Construction actually manages money—not a textbook version of construction accounting.

2. Current Accounting Operations at LV Construction

LV Construction operates with an established finance team: a CFO ($250K) who manages financial strategy, lender/investor relationships, and PE readiness, and a Controller ($150K) who oversees day-to-day accounting operations, job cost reconciliation, and financial reporting. This team is supplemented by AP/AR staff handling transaction processing. The accounting function touches every project through a dozen distinct workflows, most of which involve significant manual data entry, reconciliation, and document assembly that the CFO and Controller must oversee but should not be performing.

2.1 Complete Accounting Workflow Map

Workflow	Current Process	Frequency / Volume	Time Per Cycle
Subcontractor Pay App Processing	Sub submits pay app; PM verifies % complete in field; accounting matches to committed cost; processes	15–25 subs per project, monthly per project; 5–10 projects = 75–250 pay apps/month	20–45 min per pay app (verification + entry + approval routing)

	payment after retention hold		
Owner Pay App / Draw Request	PM assembles backup (schedule, cost, photos, compliance docs); accounting prepares AIA-format pay app; routes for owner/lender approval	Monthly per project; 5–10 active = 5–10/month	2–4 hours per draw (assembly + reconciliation)
Job Cost Reconciliation	Compare committed costs, actual costs, and budget at the cost-code level. Identify variances. Update cost-to-complete forecasts.	Monthly per project; more frequent for troubled projects	2–6 hours per project per month
WIP Schedule / Over/Under Billing	Calculate earned revenue vs. billed revenue for each project. Determine over/under billing positions. Critical for financial statement accuracy and bonding capacity.	Monthly or quarterly	4–8 hours total across all projects
Certified Payroll / Prevailing Wage	Collect timecards from crews; verify hours by classification; check rates against prevailing wage tables; generate certified payroll reports (WH-347); submit to compliance authority	Weekly for each prevailing wage project; 3–8 PW projects active	1–3 hours per project per week
Retention Tracking	Track retention held from each sub (typically 5–10%). Track retention held by owner from GC. Manage release requests at substantial completion and final completion.	Ongoing; releases triggered by milestone	30–60 min per release event; tracking is continuous
Purchase Order Management	Create POs for materials; track against budget; match to delivery receipts and invoices; three-way match (PO → receipt → invoice)	10–30 POs per project over life	15–30 min per PO cycle (create + match + close)
Change Order Cost Tracking	When COs are approved, update committed costs, budget, and schedule of values. Reconcile CO revenue against CO cost. Track pending COs as contingent liabilities.	3–15 COs per project	30–60 min per CO (accounting entries + SOV update)
Month-End Close	Reconcile all job cost accounts to GL; accrue unbilled costs; recognize revenue (% complete or completed contract); prepare financial statements;	Monthly	2–5 days total each month

	reconcile bank accounts		
Lender / Investor Reporting	For LIHTC/affordable projects: monthly construction progress reports to tax credit investors; quarterly financial reporting; annual audit support	Monthly/quarterly per project	2–4 hours per report
Tax Compliance	1099 preparation for subs; sales/use tax tracking on materials; quarterly estimated tax payments; annual entity tax returns; multi-state compliance (CA/NJ)	Annual + quarterly	Seasonal: 40–80 hours annually
Insurance / COI Management	See Section 4 (dedicated analysis)	Ongoing; 15–25 subs per project	See Section 4

2.2 Time and Cost Summary: Current State

Aggregating across all workflows for a GC running 8 active projects at $65M annual revenue:

Category	Estimated Hours/Month	Annual Cost (@ $45–65/hr loaded)
Sub pay app processing	40–75 hrs	$22–59K
Owner draws / lender reporting	16–40 hrs	$9–31K
Job cost reconciliation + WIP	20–56 hrs	$11–44K
Certified payroll / prevailing wage	12–24 hrs	$6–19K
Retention, POs, COs, month-end, tax	30–60 hrs	$16–47K
Insurance / COI management	8–20 hrs	$4–16K
TOTAL	**126–275 hrs/month**	**$68–216K/year**

At 126–275 hours per month, accounting requires 0.75–1.6 FTEs at current scale. As LV Construction grows to 12 projects at $95–140M revenue, these hours scale to 200–425/month—1.2–2.5 FTEs—unless automation intervenes. Without AI, the company needs to hire 1–2 additional accounting staff ($75–130K each, $150–260K loaded) just to keep pace with project growth.

3. AI Automation Opportunities: Workflow by Workflow

Each accounting workflow is scored on the same five-dimension automation framework used in the Mission Control business plan: volume, repeatability, data availability, error cost, and technical complexity. The key insight: most accounting workflows score higher on automation readiness than field operations workflows because accounting data is already structured (invoices, cost codes, GL entries) and the processes are highly repetitive.

3.1 Subcontractor Pay Application Processing

Current pain: PM verifies percent-complete in the field, then communicates to accounting (often verbally, by email, or via a marked-up spreadsheet). Accounting manually enters the approved amount into the accounting system, calculates retention, and processes payment. The handoff between field verification and accounting entry is the primary failure point—approved amounts that don't match, retention percentages that differ from the subcontract, and invoices that arrive before field verification is complete.

AI automation: Mission Control's field data already captures percent-complete by trade and area. The system can auto-match sub pay apps against field-verified progress, flag discrepancies (sub claims 60% complete, field data shows 45%), calculate retention automatically from subcontract terms, and route for PM approval with a single click rather than manual reconciliation. Post-approval, the system pushes the approved amount directly to the accounting software via API, eliminating manual data entry entirely.

Estimated time savings: 60–75% reduction. Pay app processing drops from 20–45 minutes to 5–15 minutes per pay app (review + approve, not enter + reconcile + calculate).

Automation score: 8.4/10 (high volume, high repeatability, data available from Mission Control, medium error cost, low-medium technical complexity).

3.2 Owner Pay Application / Lender Draw Requests

Current pain: The draw request is the single most time-consuming accounting document. It requires assembling: current schedule of values with percent-complete by line item, cost backup, conditional and unconditional lien waivers from all subs paid in the prior period, current photos, schedule update, compliance documentation (prevailing wage, insurance), and cover letter. The PM and accounting staff spend 2–4 hours per project per month assembling this package, often chasing subs for lien waivers and insurance certificates.

AI automation: Mission Control already produces real-time percent-complete, cost data, and photos. The system auto-generates the schedule of values from live project data, auto-populates the AIA G702/G703 forms, pulls current photos from the field app, generates the compliance documentation from the prevailing wage module and insurance tracker (see Section 4), and creates a checklist of outstanding lien waivers with automated reminders to subs. The PM reviews and approves a pre-assembled package rather than building it from scratch.

Estimated time savings: 70–80% reduction. Draw assembly drops from 2–4 hours to 30–60 minutes per project (review + approve a pre-assembled package).

Automation score: 9.1/10 (very high volume at scale, extremely repetitive format, all data available in Mission Control, high error cost if draws are rejected, low-medium technical complexity—primarily template + data merge).

3.3 Job Cost Reconciliation

Current pain: Monthly comparison of committed costs (subcontracts + POs), actual costs (invoices processed), and original budget at the cost-code level. Requires manually pulling data from the accounting system and comparing to the PM's project tracking. Variances are investigated one by one. Cost-to-complete projections are updated based on PM judgment. This is tedious, error-prone, and often completed 2–3 weeks after month-end.

AI automation: Mission Control's Financial Command Center connects field progress data with accounting data in real time. Job cost reconciliation becomes continuous rather than monthly: the system flags cost code variances as they occur, not 3 weeks later. AI identifies patterns—which cost codes consistently run over, which subs consistently bill ahead of progress, which project types have predictable variance profiles. Cost-to-complete projections are generated daily from actual burn rate versus physical progress, replacing monthly PM estimates.

Estimated time savings: 70–80% reduction in manual reconciliation time. More importantly, variances are caught in real time rather than weeks after the fact, preventing cost overruns from compounding.

Automation score: 8.7/10 (high volume, high repeatability, data available from accounting API + Mission Control, very high error cost if overruns go undetected, medium technical complexity).

3.4 WIP Schedule / Over-Under Billing

Current pain: Calculating earned revenue versus billed revenue for each project to determine over/under billing positions. Critical for financial statement accuracy, bonding capacity, and bank covenant compliance. Currently requires PM input on percent-complete (which is often a rough estimate) and manual spreadsheet calculation.

AI automation: With Mission Control tracking real-time percent-complete from field data and the accounting API providing billed amounts, WIP calculations become automatic and continuous. The system generates WIP schedules on demand—not just monthly. Bonding companies and banks get accurate positions whenever needed, not stale data from last month-end.

Estimated time savings: 80–90% reduction. WIP goes from a 4–8 hour monthly exercise to a dashboard that updates in real time.

Automation score: 9.0/10.

3.5 Certified Payroll / Prevailing Wage Compliance

Current pain: For every prevailing wage project (LIHTC, ED1, publicly funded), weekly certified payroll reports (WH-347) must be generated for all LV Construction field staff and verified for all subcontractors. This requires: collecting timecards with hours by classification, verifying wage rates against applicable prevailing wage determinations (which vary by project location and trade), calculating fringe benefit compliance, and submitting reports to the compliance authority. Errors are caught at audit—sometimes years later—and can result in back pay, penalties, and debarment.

AI automation: Direct labor timecards flow from the field app into the system with hours, classifications, and project assignments. The system auto-verifies wage rates against the applicable prevailing wage determination (stored per project), calculates fringe benefit obligations, flags any underpayment before payroll is processed (not after), and generates WH-347 forms automatically. For sub-certified payroll, the system tracks submission status, flags late or missing reports, and cross-references sub pay rates against prevailing wage tables.

Estimated time savings: 65–75% reduction. More importantly, compliance errors are caught before they happen rather than at audit.

Automation score: 8.9/10 (high volume on PW projects, extremely repetitive, data available from timecards, very high error cost—back pay + penalties + debarment risk, medium technical complexity).

3.6 Retention Tracking and Release

Current pain: Track retention held from each sub (typically 5–10% of each pay app). Track corresponding retention held by owner from GC. Manage release timing: 50% at substantial completion, remaining at final completion and close-out. Chase subs for final lien waivers, warranty letters, and close-out documentation before releasing retention. Track retention receivable from owner on the same timeline. The spreadsheet that tracks this across 15–25 subs on 8–10 projects is a liability time bomb.

AI automation: The system maintains a real-time retention ledger for every sub on every project, calculated automatically from processed pay apps. It tracks milestones (substantial completion, final completion) and auto-generates retention release checklists when triggered. It sends automated reminders to subs for outstanding close-out documentation (final lien waiver, warranty letter, as-builts, O&M manuals). It alerts accounting when retention is eligible for release and when retention receivable from the owner should be billed.

Estimated time savings: 50–60% reduction in tracking time. Elimination of ‘forgotten’ retention—both payable and receivable.

Automation score: 8.0/10.

3.7 Purchase Order Three-Way Matching

Current pain: For material purchases, accounting must match three documents: the original PO (what was ordered and at what price), the delivery receipt (what was received), and the vendor invoice (what is being billed). Mismatches in quantity, price, or item are common and require investigation. At 10–30 POs per project across 8–10 projects, this is a high-volume, error-prone process.

AI automation: POs are created in the system with line-item detail. Delivery receipts are logged via the field app (photo of delivery ticket + confirmation of quantities). Vendor invoices are ingested via OCR/AI document processing (scan the PDF invoice, extract line items, match against PO and receipt). The system auto-approves invoices where all three match within tolerance. Discrepancies are flagged for human review with specific items highlighted. Only exceptions require human attention.

Estimated time savings: 70–80% reduction. Auto-match handles 70–80% of POs; humans review only exceptions.

Automation score: 8.5/10.

3.8 Month-End Close Acceleration

Current pain: The month-end close process for a multi-project GC typically takes 2–5 business days. Activities include: posting all outstanding invoices, reconciling job cost accounts to GL, accruing unbilled costs, recognizing revenue (percentage of completion), reconciling bank accounts, preparing financial statements, and running variance analysis. Much of this time is spent on data assembly and reconciliation, not analysis or judgment.

AI automation: With real-time data flowing from field and accounting systems, most close activities happen continuously rather than in a batch at month-end. Job cost is reconciled daily. Revenue recognition calculations run automatically from percent-complete data. Unbilled cost accruals are calculated in real time. Bank reconciliation uses transaction matching algorithms. The close becomes a verification exercise (confirm the system’s calculations are correct) rather than an assembly exercise (gather and reconcile all the data). Target: reduce close from 3–5 days to 1 day.

Estimated time savings: 60–70% reduction in close time. Close shifts from Day 15–20 to Day 3–5 after month-end.

Automation score: 8.2/10.

3.9 Lien Waiver Collection and Management

Current pain: Every sub payment requires a corresponding lien waiver (conditional upon receipt of payment, then unconditional after payment clears). On a project with 20 subs and 12 monthly draws, that is 240 conditional + 240 unconditional waivers per project per year. Multiply by 8 projects and the GC is managing ~3,840 lien waiver documents annually. Missing a lien waiver

exposes the owner (and by extension the GC) to double-payment risk and lien claims. This is almost always tracked in a spreadsheet and managed by chasing subs via email and phone.

AI automation: The system auto-generates conditional lien waivers from templates pre-populated with sub information, project details, and pay app amounts. Waivers are sent to subs for electronic signature (DocuSign/HelloSign integration) concurrent with payment notification. The system tracks signature status, sends automated reminders, and blocks the next pay app processing if prior-period waivers are outstanding. Unconditional waivers are triggered automatically when payment clears the bank. The lender draw package pulls current waiver status in real time—no more last-minute chasing.

Estimated time savings: 80–90% reduction. Elimination of manual chasing, template filling, and tracking.

Automation score: 9.2/10 (extremely high volume, 100% repetitive, template-based, high error cost—lien exposure, simple technical implementation with e-signature API).

---

4. Subcontractor Insurance: COI Collection, Monitoring, and Compliance

This section addresses a critical risk management gap. Subcontractor insurance compliance is not mentioned in the current Mission Control business plan, yet it represents one of the highest-consequence operational risks a GC faces. A single uninsured sub on a job site can result in millions of dollars in liability exposure.

4.1 The Problem

On a typical LV Construction project, 15–25 subcontractors must each maintain current certificates of insurance (COI) meeting specific requirements:

- General liability insurance: minimum $1M per occurrence / $2M aggregate, with LV Construction named as additional insured on a primary and non-contributory basis.
- Workers’ compensation insurance: statutory limits as required by California law. No exceptions. No gaps.
- Auto liability insurance: minimum $1M combined single limit for subs with vehicles on site.
- Umbrella/excess liability: $2–5M depending on contract value and risk profile.
- Waiver of subrogation endorsement in favor of LV Construction on all policies.
- Professional liability (E&O): for design-build subs or engineering subs.

Each COI has an expiration date—typically the policy anniversary, which is different for every sub. Policies can be cancelled mid-term. Coverage limits can change at renewal. The additional insured endorsement can be dropped. And California law is unforgiving: if a sub’s workers’ comp lapses and one of their employees is injured on your job site, the GC is exposed under the contractor’s license law.

4.2 Current State: How Most GCs Manage This

The honest answer: poorly. The typical process at a mid-size GC:

1. **Collection:** During buyout, the PM or office admin requests a COI from each sub before they start work.

2. **Verification:** Someone (PM, admin, or accounting) reviews the COI against the subcontract insurance requirements. This is manual, error-prone, and often cursory—checking that the certificate exists, not that it actually meets the specific contractual requirements.

3. **Storage:** COIs are filed—in a project folder, in an email, in a drawer. There is no automated tracking of expiration dates. When a COI expires (which happens continuously throughout a project), the sub may or may not send a renewal. The GC may or may not notice the lapse.

4. **Ongoing monitoring:** Rare. Most GCs do a single check at mobilization and never verify again unless prompted by an incident, a lender audit, or a safety concern. By the time someone checks, the COI may have been expired for months.

5. **Escalation:** Usually triggered by a panic—an incident occurs, a lender asks, or the owner's insurance broker does an audit. At that point, the office scrambles to collect updated COIs from all subs, discovers that 20–40% are expired or non-compliant, and spends days chasing renewals.

4.3 The Risk: What Goes Wrong

Scenario	Exposure	Frequency
Sub's workers' comp lapses; worker injured on site	GC liable under CA contractor's license law. Direct medical costs, indemnity payments, OSHA penalties. Potential license suspension.	3–5% of subs lapse at any given time across the industry. On a project with 20 subs, 1–2 lapses per year is typical.
Sub's GL policy cancelled mid-term	No additional insured coverage for GC. If a third party is injured by sub's work, GC is exposed directly. Lender/owner indemnification requirements breached.	Uncommon but not rare. Triggered by sub's non-payment of premiums—often a sign of financial distress.
COI does not actually match subcontract requirements	Coverage limits too low, additional insured not included, waiver of subrogation missing. GC believes they are covered but the policy does not actually respond to a claim.	Extremely common. Estimated 15–30% of COIs at any GC do not fully comply with subcontract requirements when closely reviewed.
Expired COI not caught; lender or	Draw held, construction financing delayed, potential default. Owner	Common at lender inspections and annual audits. Often triggers 1–2

owner audit discovers	loses confidence in GC's management. Lender requires corrective action plan.	week scramble to bring all COIs current.

4.4 AI-Automated Insurance Compliance System

The insurance compliance module integrates into Mission Control as an extension of the subcontractor management function. It covers the full lifecycle: requirements definition, collection, verification, monitoring, and escalation.

4.4.1 Requirements Engine

For each subcontract, the system stores the specific insurance requirements: coverage types, minimum limits, endorsements required (additional insured, waiver of subrogation, primary and non-contributory), and any project-specific requirements imposed by the owner or lender. These are extracted from the subcontract terms during buyout and entered once. The system validates every COI received against these specific requirements—not just 'does a COI exist' but 'does this COI meet our contractual requirements.'

4.4.2 Collection and Intake

- Automated request: when a subcontract is executed, the system sends an automated request to the sub for their COI, specifying exactly what is required (coverage types, limits, endorsements, additional insured language). The request includes a portal link where the sub can upload their COI directly.
- OCR/AI document processing: uploaded COIs (typically PDFs) are processed by AI document intelligence—the same LLM-based document processing used for RFIs and submittals in Module 4. The system extracts: insurance carrier, policy numbers, coverage types, limits, effective and expiration dates, additional insured status, waiver of subrogation status, and named insured.
- Auto-verification: extracted data is compared against the stored requirements for that specific subcontract. Compliant COIs are automatically approved. Non-compliant COIs generate a specific deficiency notice to the sub: 'Your general liability limit is $400K per occurrence; the subcontract requires $1M. Please provide an updated certificate.'
- Integration with existing COI platforms: if LV Construction or its subs use a COI management platform (myCOI, PINS, CertFocus, TrustLayer), the system integrates via API. If not, the portal + AI processing approach handles it natively.

4.4.3 Continuous Monitoring

- Expiration tracking: every COI expiration date is tracked. The system sends automated renewal reminders to subs at 60 days, 30 days, 14 days, and 7 days before expiration.
- Escalation ladder: at 7 days pre-expiration with no renewal received, the system alerts the PM. At expiration with no renewal, the system alerts Grady and flags the sub as non-compliant in the Mission Control dashboard. The sub's next pay application is automatically held pending insurance compliance.

- Mid-term cancellation monitoring: where supported by carrier or COI platform integration, the system monitors for mid-term policy cancellations or material changes. Not all carriers support this, but many now provide automated cancellation notices.
- Dashboard: a single view showing every sub on every active project with their insurance compliance status—green (current and compliant), yellow (expiring within 30 days), red (expired or non-compliant). This dashboard is the first thing the office admin checks each morning.

4.4.4 Lender/Owner Reporting

When lender draws or owner audits require proof of sub insurance compliance, the system generates a complete insurance compliance report in minutes: every sub, every project, every policy, every expiration date, and the verification status of every requirement. No more 2-day scramble before a draw.

4.5 Insurance Module: Build vs. Buy

Option	Pros	Cons
Build natively in Mission Control	Fully integrated with sub management, pay apps, and draw packages. No additional SaaS cost. Complete control over features and data.	Engineering time: 2–4 weeks of Full-Stack Engineer time for the portal + OCR integration. Does not include carrier-level monitoring without third-party integration.
Buy: integrate with TrustLayer, myCOI, or PINS	Carrier-level monitoring for cancellations. Established OCR and verification. Sub-facing portal already built. Compliance audit trail.	SaaS cost: $5–15K/year depending on sub count. Integration work required to connect with Mission Control for pay app holds and draw reporting.
Hybrid: buy monitoring + build integration	Best of both: carrier-level monitoring from the COI platform, native integration with Mission Control for pay app holds, draw packages, and the compliance dashboard.	Requires API integration work and SaaS subscription.

Recommendation: Hybrid approach. Use TrustLayer or myCOI for the core COI monitoring and sub-facing portal (they have already solved the hard problems of carrier integration and OCR verification). Integrate via API with Mission Control so that: (a) non-compliant subs automatically have pay apps held, (b) the draw package pulls real-time compliance status, and (c) the Mission Control dashboard shows insurance status alongside schedule, cost, and quality data.

5. Consolidated Automation Impact: Before and After

Workflow	Current Hrs/Mo	Automated Hrs/Mo	Savings %	Annual $ Saved	Auto. Score
Sub pay apps	40–75	12–22	65–70%	$15–42K	8.4
Owner draws / lender	16–40	4–10	70–80%	$7–23K	9.1
Job cost / WIP	20–56	5–15	70–80%	$8–32K	8.7
Certified payroll	12–24	3–8	65–75%	$5–13K	8.9
Retention / PO / CO / close	30–60	10–20	60–70%	$11–31K	8.2
Lien waivers	8–15	1–3	80–90%	$4–10K	9.2
Insurance / COI	8–20	2–5	70–80%	$3–12K	8.6
TOTAL	**134–290**	**37–83**	**68–72%**	**$53–163K/ yr**	**8.6 avg**

At 68–72% automation, the accounting function that currently requires 0.75–1.6 FTEs can handle the growth to $95–190M revenue without additional headcount. The existing accounting team transitions from data entry and reconciliation to exception handling, analysis, and strategic financial management. This is the same pattern as the field operations automation: human expertise is preserved for judgment-intensive work while repetitive coordination is absorbed by the system.

6. Integration with Mission Control: Architecture

The accounting automation does not require a separate technology investment. It leverages the same infrastructure being built for Mission Control:

Mission Control Component	Already Planned	Accounting Extension (New)
Data Warehouse	Project data, field reports, schedules, photos	Add: GL data, AP/AR transactions, job cost tables, sub payment history, retention ledger
API Integrations	Accounting software (Sage/QB/Yardi), PM tools	Add: bidirectional write-back to accounting system (push approved pay apps, pull invoice data). Add: COI platform API (TrustLayer/myCOI). Add: e-signature API (DocuSign).
Document Intelligence (Module 4)	RFI drafting, submittal routing, CO benchmarking	Add: invoice OCR and data extraction. COI document processing and verification. Lien waiver auto-generation.
Financial Command Center (Module 5)	Real-time cost tracking, draw packages, prevailing wage	Add: full AP/AR automation, retention tracking, WIP auto-calculation, three-way PO

		matching, month-end close acceleration.
Dashboard	Schedule, cost, quality, risk views	Add: accounting dashboard (AP aging, AR aging, retention positions, insurance compliance, WIP). Add: office admin view.
Field Mobile App	Daily reporting, photo capture	Add: delivery receipt logging (photo + confirmation for PO matching). Material inventory tracking.

Estimated incremental engineering effort to include accounting automation in the Mission Control build: 3–6 weeks of Full-Stack Engineer time spread across Sprints 2–3 (Months 6–12). The invoice OCR and COI processing leverage the same LLM-based document intelligence being built for RFIs and submittals. The accounting API integrations are already scoped as part of Sprint 3 (Financial Integration). The incremental effort is primarily: building the AP/AR automation workflows, the retention tracker, the lien waiver module, and the COI integration.

7. Incremental Cost to Add Accounting Automation

Item	One-Time	Annual Ongoing
COI platform subscription (TrustLayer or myCOI)	—	$5–15K/year
E-signature platform (DocuSign for lien waivers)	—	$2–5K/year
Additional LLM API usage (invoice OCR, COI processing)	—	$2–5K/year
Full-Stack Engineer time (3–6 weeks incremental)	$10–20K (opportunity cost)	—
TOTAL INCREMENTAL COST	**$10–20K**	**$9–25K/year**

Compare this to the alternative: hiring 1–2 additional accounting staff as project count grows ($150–260K/year loaded) plus the ongoing liability risk of manual insurance tracking. The ROI on accounting automation is immediate and substantial—$53–163K/year in labor savings plus unquantifiable risk reduction from automated insurance compliance, for an incremental investment of $19–45K/year.

8. Staffing: Existing Finance Team Integration

LV Construction has an established finance team that provides the domain expertise for accounting automation. These are not new hires—they are existing senior staff who participate in the Mission Control mapping process as primary stakeholders alongside Grady and the field team.

Role	Current Duties	Post-Automation Duties
CFO ($250K)	Financial strategy, lender/investor relationships, WIP oversight, bonding management, month-end close review, PE readiness preparation, multi-entity tax coordination	Strategic financial leadership; PE transaction preparation; capital markets relationships; exception review on auto-generated financial reports; system validation and continuous improvement; financial modeling for new project pursuits
Controller ($150K)	Day-to-day accounting operations: GL management, job cost reconciliation, AP/AR oversight, certified payroll review, retention tracking, month-end close execution, financial statement preparation, audit support	System oversight and exception handling; complex dispute resolution; audit management; compliance quality assurance; process refinement as Mission Control matures; training accounting staff on AI-augmented workflows
AP/AR Staff	Manual invoice entry, pay app processing, retention tracking, check runs, lien waiver collection, COI chasing	Exception handling on auto-matched invoices; vendor relationship management; complex dispute resolution; close-out documentation management

The CFO and Controller are essential participants in the mapping phase. The Construction-AI Translator shadows the accounting team using the same methodology applied to field operations: ride-along observation, process documentation, time allocation analysis, and failure mode cataloging. The CFO’s strategic perspective identifies which financial workflows require human judgment (lender negotiations, bonding decisions, PE positioning) versus which are pattern-matchable and automatable (pay app verification, WIP calculation, certified payroll generation). The Controller’s operational knowledge ensures the system reflects actual accounting practice, not idealized process flows.

With automation handling 68–72% of coordination overhead, the existing finance team handles the growth from $45M to $190M in revenue without adding accounting headcount. The CFO transitions from data assembly to strategic financial leadership. The Controller transitions from reconciliation to system oversight and exception management. Both roles become more valuable, not less, in an AI-augmented environment.

9. Implementation: Built Into Mission Control From Day One

Accounting automation is not a separate initiative layered on after the field platform is built. It is mapped during the same observation period, built during the same sprints, and deployed on the same timeline. The Construction-AI Translator shadows the CFO and Controller using the same ride-along methodology applied to Grady and the superintendents. The accounting workflows are documented in the same Process Library, scored by the same automation framework, and prioritized alongside field workflows in the engineering roadmap.

Sprint	Months	Mission Control Deliverable	Accounting Extension
Sprint 1	3–6 (Data Foundation)	Data warehouse, field app, daily reporting	Include GL data tables and AP/AR schema in warehouse design. Begin COI platform evaluation.
Sprint 2	6–9 (Document Intelligence)	RFI drafting, submittal routing, CO benchmarking	Add invoice OCR/extraction to document AI module. Add COI document processing. Integrate e-signature for lien waivers.
Sprint 3	9–12 (Financial Integration)	Real-time cost tracking, draw packages, certified payroll	Full AP/AR automation, retention tracker, three-way PO matching, lien waiver automation. COI platform integration live. Sub pay app auto-matching live.
Sprint 4	12–15 (Smart Scheduling)	Scheduling engine, crew optimization	Month-end close acceleration. WIP auto-calculation. Accounting dashboard live. Full insurance compliance monitoring operational.

By Month 15, the accounting function is fully integrated into Mission Control. The existing accounting team operates from the same platform as the PM, superintendent, and Grady—a single source of truth for financial, operational, and compliance data.

10. Risk Reduction: Quantifying the Insurance Compliance Value

The insurance automation module’s value is not primarily in time savings—it is in risk elimination. A back-of-envelope calculation:

- Assume 8 active projects, 20 subs per project = 160 active sub-COI relationships.

- Industry data suggests 3–5% of COIs are non-compliant at any given time without active monitoring = 5–8 non-compliant subs across the portfolio at any moment.
- Average workers' comp claim in California construction: $40–80K. Serious injury: $200K–$1M+. Fatality: $1M+.
- If an uninsured sub's employee is injured and the GC is exposed, the expected cost (probability-weighted) is material—even a single incident can exceed $400K in direct costs plus potential license jeopardy.
- The annual cost of automated COI monitoring ($5–15K) is less than 1/50th the cost of a single serious uninsured incident. This is one of the highest-ROI risk management investments available.
