JOB DESCRIPTIONS

AI Mission Control Team Build

10 Roles Across Construction Operations,
AI Engineering, and Field Technology

CONFIDENTIAL

Six Peak Capital | LV Construction

Supporting Document to AI Mission Control Business Plan

March 2026

Overview

This document contains the complete job descriptions for all 10 roles contemplated in the AI Mission Control business plan. The roles are presented in hiring sequence order. Each description includes: role metadata, responsibilities, required and preferred qualifications, compensation benchmarks, success metrics, failure indicators, and sourcing recommendations.

#	Role	Month	Base Comp	Loaded	Category
1	**Construction-AI Translator**	1	$130–175K	$169–228K	Bridge / Interim
2	**Assistant Project Manager**	1–2	$65–90K	$85–117K	Construction
3	**Additional Superintendent**	1–2	$100–140K	$130–182K	Construction
4	**Field Tech Liaison**	2–3	+$10–20K	+$13–26K	Internal Promotion
5	**Head of AI Operations**	3–4	$180–250K	$234–325K	AI Leadership
6	**Process Engineer / Analyst**	4–5	$85–115K	$111–150K	AI Team
7	**Full-Stack Engineer**	5–6	$135–185K	$176–241K	AI Team
8	**AI/ML Engineer**	6–8	$132–217K	$172–282K	AI Team
9	**Data Engineer**	12–14	$125–175K	$163–228K	AI Team (Phase 2)
10	**Computer Vision Specialist**	14–18	$150–210K	$195–273K	AI Team (Phase 2)

1. Construction-AI Translator

The most important hire in the entire plan.

	Details
Department	Construction Operations / Technology
Reports To	Grady Lakamp, CEO
Location	Los Angeles, CA (on-site daily at active construction projects)
Employment Type	Full-time, interim engagement (18–24 months) with conversion potential
Hire Timing	Month 1 — first hire before any AI team member
Compensation	$130–175K base + 15–20% performance bonus tied to mapping milestones
Conversion Path	Director of Construction Technology or VP of Construction Innovation

About the Role

LV Construction is building an AI-powered operating system for construction—what we call Mission Control. Before a single line of code is written, someone must map exactly how our operations team builds $10–40M Type 3A over Type 1 podium multifamily projects today. That person is you. You will spend mornings on active job sites with our CEO and superintendents, documenting every decision, workflow, and judgment call. Afternoons, you will translate those observations into structured specifications that an AI engineering team can build from. You are not a COO. You are not here to change how we build. You are here to document it, decode it, and bridge it to the technology team. Your output—the Process Library—becomes the literal blueprint for the AI system. If you do this well, you will have built the foundation of a company worth $150–250M+.

Key Responsibilities

- Shadow Grady Lakamp and superintendents on active job sites daily during the mapping phase (6:00 AM start). Observe and document morning coordination, field decisions, crew management, and problem resolution in real time.
- Produce the Process Library: process flow diagrams, RACI matrices, data flow maps, time allocation breakdowns, failure mode catalogs, and AI automation scores for all 16 functional areas across 4 phases of construction.
- Conduct the 30-day decision log: facilitate daily logging by PMs and superintendents of every decision made, information used, time taken, and outcome. This creates the training dataset for the AI system.
- Translate field observations into structured system design specifications for the Head of AI Ops and engineering team. Participate in sprint planning and prototype review sessions.
- Conduct ride-along interviews, tool and system inventories, time audits, handoff mapping, and failure mode collection across all roles in the LV Construction team.
- Validate all process documentation with Grady and field staff to ensure accuracy—the system is only as good as the map.
- Identify which decisions are pattern-matchable (estimated 70–80%) versus truly novel (20–30%). The pattern-matchable decisions are the automation targets.

- Serve as the field team's voice to the AI team and the AI team's translator to the field. Ensure nothing gets built that does not match how construction actually works.
- Evaluate and score each process step on five dimensions (volume, repeatability, data availability, error cost, technical complexity) to prioritize the AI build roadmap.

Required Qualifications

- 7–12 years of construction experience with direct field roles: superintendent, project manager, or project engineer on Type 3A over Type 1 podium multifamily projects.
- Deep understanding of construction workflows: scheduling, cost management, quality control, subcontractor coordination, and document management.
- Proven ability to document complex processes in structured, clear formats (flowcharts, matrices, written specifications). You think in systems, not just tasks.
- Technology literacy: you understand what data, software, and AI systems can do. You do not need to write code, but you need to recognize what is automatable and what requires human judgment.
- Field credibility: superintendents and crews trust you. You can walk a job site and earn respect from people who have been building for 20 years.
- Comfort operating between two very different cultures: construction (early mornings, field conditions, direct communication) and technology (sprint planning, product specs, iterative development).

Preferred Qualifications

- Experience with affordable housing construction: LIHTC, prevailing wage, ED1 projects.
- Experience with Procore, P6, or other construction PM software.
- Previous involvement in process improvement, lean construction, or technology implementation at a GC.
- Construction management degree (USC, Stanford CEE, Georgia Tech, Virginia Tech) or industrial engineering background.
- Prior experience at a ConTech company (Procore, PlanGrid, OpenSpace) with construction-side background.

Compensation

$130–175K base salary with 15–20% performance bonus tied to specific mapping milestones (Process Library completion, decision log quality, AI team buildability rating). Loaded cost at 1.3x: $169–228K. After the interim period (18–24 months), the role may convert to a permanent Director of Construction Technology or VP of Construction Innovation based on performance and company needs.

Success Metrics (6-Month Gate)

- Process Library v1 complete for at least 12 of 16 functional areas within 6 months.
- 30-day decision log completed with entries specific enough for the AI team to build system specifications from.
- Head of AI Ops rates translated requirements as 'buildable'—clear enough to begin engineering sprints.
- Grady validates that documentation accurately reflects how LV Construction actually operates.

- At least 3 functional areas have complete automation scores with build priority recommendations.

Failure Indicators

- Process documentation reads like a textbook rather than describing LV Construction's specific operation.
- AI team cannot translate the output into buildable system requirements—the bridge is not actually bridging.
- Field crews and superintendents are resistant to your presence—you lack field credibility.
- Grady is spending more time explaining things to you than if he did the mapping himself.

Where to Find This Person

- Senior PMs or superintendents at mid-size LA general contractors: Turner, Morley, Bernards, MATT Construction, Swinerton. LinkedIn search: PM + affordable housing + Los Angeles.
- Construction technology consultants from firms like Plenary Group or Cumming Corporation.
- PMs from affordable housing developers: Related, BRIDGE Housing, National CORE, Meta Housing.
- CM graduate programs (USC, Stanford CEE, Georgia Tech, Virginia Tech)—someone with 7+ years field experience who went back for an MS.
- ConTech startup alumni who came from construction: Procore, PlanGrid, OpenSpace alumni who were PMs or supers.

2. Assistant Project Manager / Project Engineer

Free PM capacity for the mapping process while handling day-to-day coordination.

	Details
Department	Construction Operations
Reports To	Project Manager (or Grady Lakamp directly)
Location	Los Angeles, CA (office + job sites)
Employment Type	Full-time
Hire Timing	Month 1–2
Compensation	$65–90K base

About the Role

LV Construction is growing from 5–7 to 8–12 active projects over the next 3 years while simultaneously building an AI-powered operations platform. Our existing PM needs 5–8 hours per week freed for the mapping process that will define how the AI system works. Your job is to take over daily coordination tasks—scheduling sub meetings, processing submittals, tracking RFIs, assembling draw packages—so the PM can participate meaningfully in the operational audit. The irony: the tasks you handle are exactly the ones the AI system will automate first. You will have a front-row seat to the construction technology transformation and will be one of the first people to use the Mission Control platform as it comes online.

Key Responsibilities

- Process and track subcontractor submittals through the review cycle. Route to architect/engineer, track response times, flag critical-path items.
- Draft and manage RFIs: coordinate with field teams to identify questions, prepare RFI documentation, track ball-in-court status, and log responses.
- Assist with monthly owner pay applications and lender draw request package assembly. Collect field photos, progress data, and compliance documentation.
- Maintain project schedules: update 3-week lookaheads based on superintendent input, track milestone progress, flag schedule deviations to PM.
- Coordinate subcontractor meetings: prepare agendas, distribute minutes, track action items.
- Track change order requests: log CORs, compile backup documentation, and maintain COR status spreadsheets.
- Manage project document control: drawing logs, specification revisions, transmittals, and meeting minutes.
- Support buyout process: track subcontract execution status, insurance certificate collection, and prequalification documentation.
- Participate in the AI system mapping process by documenting your own workflows as the Translator observes—your daily tasks will be among the first to be partially automated.

Required Qualifications

- 1–4 years of construction experience: project engineering, assistant PM, or construction office role.

- Strong organizational skills and attention to detail. You track 50 open items across 3 projects without dropping anything.
- Proficiency with construction PM software (Procore, PlanGrid, or similar) and Microsoft Office (especially Excel and Project).
- Basic understanding of construction documents: plans, specifications, RFIs, submittals, and change orders.
- Effective written and verbal communication. You interact with subcontractors, architects, owners, and field crews daily.
- Bachelor’s degree in construction management, civil engineering, architecture, or related field.

Preferred Qualifications

- Experience with Type 3A over Type 1 podium multifamily construction in Los Angeles.
- Familiarity with affordable housing compliance: prevailing wage, LIHTC documentation, ED1 processes.
- OSHA 30-hour certification.
- Interest in construction technology and willingness to be an early adopter of new tools.

Compensation

$65–90K base salary depending on experience. Loaded cost at 1.3x: $85–117K. LA market rate for APM roles: $65–90K (Glassdoor, Indeed). Standard benefits package including health insurance, PTO, and professional development.

Success Metrics (6-Month Gate)

- PM reports 5–8 hours/week freed for mapping process participation within 60 days of hire.
- Submittal and RFI tracking current with zero critical-path items missed.
- Draw packages assembled within specified timelines with no rework from lender.
- Positive feedback from subcontractors and design team on coordination quality.

Where to Find This Person

- Recent CM graduates from USC, Cal Poly, UCLA, or Cal State Northridge.
- Junior PMs or project engineers at small-to-mid LA general contractors looking for more responsibility.
- Construction industry job boards: BuiltWorlds, iHireConstruction, indeed.com/construction.

3. Superintendent

Maintain field operations excellence while the team grows from current team size to scaled.

	Details
Department	Construction Operations / Field
Reports To	Grady Lakamp, CEO
Location	Los Angeles, CA (on-site at active construction projects)
Employment Type	Full-time
Hire Timing	Month 1–2
Compensation	$100–140K base

About the Role

LV Construction builds 50–250 unit Type 3A over Type 1 podium multifamily projects across Los Angeles, primarily affordable housing (LIHTC, ED1). As we grow from current team size to scaled crew members and take on additional projects, we need another experienced superintendent to maintain the field execution quality that sets us apart—10–12% operating margins in an industry that averages 5–6%. You will run day-to-day field operations on assigned projects, coordinating field oversight staffs and 15–25+ subcontractors to deliver on time and on budget. You will also participate in our operational audit process—we are building an AI-powered operations platform, and your field knowledge is essential input to the system design.

Key Responsibilities

- Manage daily field operations on 1–2 active Type 3A over Type 1 podium multifamily projects ($10–40M each). Coordinate field oversight staffs and subcontractors.
- Create and maintain 3-week lookahead schedules. Communicate daily work plans to all trades on site.
- Conduct daily quality control walkthroughs. Identify and document deficiencies. Generate and track punch lists through resolution.
- Coordinate city and third-party inspections. Schedule inspections when predecessor work is complete. Manage correction and re-inspection workflow.
- Enforce site safety: conduct toolbox talks, monitor OSHA compliance, document near-misses, manage sub safety programs.
- Manage material deliveries and on-site logistics. Coordinate crane days, concrete pours, and other critical activities.
- Create daily field reports documenting manpower, activities by area, weather conditions, deliveries, and issues.
- Resolve field conflicts between trades. Manage area sequencing to prevent crew overlaps and optimize productivity.
- Participate in the AI operational audit: allow the Construction-AI Translator to shadow your daily operations, document your decision-making process, and provide feedback on proposed AI tools and workflows.
- Collaborate with the project manager on cost tracking, change order identification, and owner/lender reporting.

Required Qualifications

- 8–15 years of construction field experience with at least 5 years as a superintendent on Type 3A/Type 1 podium multifamily projects.
- Proven track record of delivering projects on time and on budget. References from recent projects required.
- Deep knowledge of Type 3A/podium construction sequencing: foundation through finish, including MEP coordination.
- Experience managing 15–25+ subcontractors simultaneously on a single project.
- Strong leadership skills: crews and subcontractors respond to your direction and respect your judgment.
- Proficiency with construction scheduling (MS Project, P6, or equivalent). Ability to read and interpret architectural and structural drawings.
- OSHA 30-hour certification. First aid/CPR certification.
- Valid California driver’s license.

Preferred Qualifications

- Experience with affordable housing construction in Los Angeles: LIHTC, prevailing wage, ED1 projects.
- Familiarity with LADBS inspection processes and timelines.
- Bilingual English/Spanish strongly preferred (majority of LA construction workforce).
- Experience with Procore or similar construction PM software for daily reporting.
- Openness to new technology: willingness to adopt a field mobile app for daily structured reporting and photo documentation.

Compensation

$100–140K base salary depending on experience. Loaded cost at 1.3x: $130–182K. LA market rate for experienced multifamily superintendents: $100–140K (Glassdoor, ZipRecruiter, Indeed). Company vehicle or vehicle allowance. Standard benefits package.

Success Metrics (6-Month Gate)

- Projects delivered within 5% of baseline schedule.
- Zero OSHA recordable incidents on assigned projects.
- Inspection pass rate above 85% on first attempt.
- Daily field reports submitted by 6 PM every working day.
- Positive feedback from Grady on field execution quality and crew management.

Where to Find This Person

- Experienced superintendents at LA-based GCs: Bernards, MATT Construction, Morley, W.E. O’Neil, Suffolk Construction.
- Trade associations: Associated General Contractors (AGC) LA chapter, LA/OC Building Trades Council.
- Construction-specific recruiters: Hays Construction, Michael Page Construction.
- Indeed, LinkedIn: superintendent + multifamily + Los Angeles.

4. Field Tech Liaison

Internal promotion — the field team's voice in the AI buildout.

	Details
Department	Construction Operations / Technology
Reports To	Grady Lakamp (construction duties) / Head of AI Ops (liaison duties)
Location	Los Angeles, CA (on-site at active construction projects)
Employment Type	Full-time (internal promotion from existing crew)
Hire Timing	Month 2–3
Compensation	Current salary + $10–20K bump + title change. Incremental loaded cost: $13–26K

About the Role

You are already on the LV Construction team. You are the person who uses your phone to organize work—photos, notes, group chats. You are the one who asks 'why do we do it this way?' instead of just executing. Others come to you with tech questions. You adapted fastest the last time we introduced a new tool. We want to give you a formal role in our AI Mission Control buildout: the Field Tech Liaison. You will spend 70% of your time on normal field duties and 30% as the bridge between the AI team and the field crews. Every tool the tech team builds gets tested by you first. You are the field team's quality control on the technology.

Key Responsibilities

- Test all field-facing tools (mobile app, reporting interfaces, photo capture workflows) before they go to the broader crew. Provide honest, detailed feedback on usability, speed, and practicality in real field conditions.
- Train crew members on new tools and workflows. Be the on-site support person when questions arise. If something breaks or confuses the crew, you are the first escalation point.
- Provide ongoing feedback to the AI team on what works and what does not work in the field. Attend weekly product review sessions (30–60 minutes, after field hours or during lunch).
- Flag when something the tech team built does not match field reality. Your job is to prevent the AI team from building tools that look great in a demo but fail in a construction trailer at 6 AM.
- Champion adoption: help your crew understand why structured data capture matters and how it will eventually make their jobs easier.
- Continue performing your existing field duties at 70% capacity. Your construction work does not stop—it is enhanced by this new responsibility.
- Document friction points in current workflows that the AI team might not see from the office. Your daily frustrations are the AI system's feature roadmap.

Required Qualifications

- Currently employed by LV Construction in a field role (crew member, foreman, laborer, or field assistant).

- Tech-savvy relative to peers: comfortable with smartphones, apps, and digital tools. Willing to learn new software.
- Respected by other field workers—your opinion carries weight with the crew.
- Curious and observant: you notice inefficiencies and wonder how things could be improved.
- Reliable communicator: you can articulate what's working and what's not in clear, specific terms (not just 'it's fine' or 'it sucks').
- Willing to spend 30% of time on liaison duties including occasional after-hours or lunch meetings with the technology team.

Preferred Qualifications

- Experience with any construction mobile app (Procore, PlanGrid, Fieldwire).
- Bilingual English/Spanish (enables training and support for the full crew).
- 1+ years with LV Construction (deep familiarity with current workflows).

Compensation

Current salary plus a $10–20K annual bump and a formal title change. Incremental loaded cost: $13–26K. This is an investment in the person who will determine whether the field team adopts the AI platform or resists it.

Success Metrics (6-Month Gate)

- Field crew adoption rate of new tools exceeds 80% within 60 days of deployment.
- Bug reports and usability issues identified and reported before tools reach the broader crew.
- Crew feedback is consistently specific and actionable—the AI team can build from your input.
- No major workflow disruptions during technology rollout.

Failure Indicators

- Crew adoption remains low despite liaison efforts—tools are being ignored in the field.
- Feedback is vague ('it doesn't work') rather than specific ('the photo upload fails when we're in the basement with no signal').
- Field duties suffer because liaison responsibilities take more time than expected.

Where to Find This Person

- Internal identification only. Grady identifies this person by answering: Who on the crew already uses their phone to organize work? Who asks 'why do we do it this way'? Who do others go to with tech questions? Who adapted fastest to the last new tool we introduced?

5. Head of AI Operations

Build the operating system for a $2 trillion industry.

	Details
Department	Technology / AI
Reports To	Grady Lakamp, CEO
Location	Los Angeles, CA (with regular job site visits)
Employment Type	Full-time with equity participation in AI platform entity
Hire Timing	Month 3–4
Compensation	$180–250K base + equity + performance bonus
Direct Reports	Up to 6: Process Engineer, Full-Stack Engineer, AI/ML Engineer, Data Engineer, CV Specialist, Field Tech Liaison (tech duties)

About the Role

LV Construction generates $45–95M in annual revenue building affordable housing in Los Angeles at 10–12% operating margins—three times the industry average. That margin comes from one person's institutional knowledge (our CEO, Grady Lakamp), which cannot scale. Your job is to take that knowledge—captured and translated by the Construction-AI Translator—and encode it into an AI-powered operating platform we call Mission Control. You will architect, build, and ship a 6-module platform: Project Intelligence Engine, Smart Scheduling, Computer Vision QC, Document Intelligence, Financial Command Center, and Risk & Compliance Engine. You will hire and lead the engineering team. You will see your code deployed on real construction sites within weeks, not buried in a feature backlog. And you will have equity in a platform positioned for a PE exit at $150–250M+ enterprise value.

Key Responsibilities

- Design the system architecture for the Mission Control platform: data warehouse, field mobile app, dashboard, AI modules, and all integrations with existing construction tools.
- Hire, manage, and develop the AI engineering team (up to 6 direct reports). Define roles, set performance expectations, and build a high-performing team culture.
- Own the technology roadmap: translate the Process Library (from the Construction-AI Translator) into a prioritized build plan organized in 6 sprints of approximately 3 months each.
- Select and implement the technology stack: cloud infrastructure (AWS/GCP), data layer (PostgreSQL/TimescaleDB), AI pipeline (PyTorch, LLM APIs), frontend (React/React Native).
- Work daily with the Construction-AI Translator to ensure system design matches field reality. Attend weekly validation sessions with Grady.
- Deliver each sprint's milestones: Sprint 1 (Data Foundation), Sprint 2 (Document Intelligence), Sprint 3 (Financial Integration), Sprint 4 (Smart Scheduling), Sprint 5 (CV QC), Sprint 6 (Predictive/Compliance).
- Manage cloud infrastructure, AI/ML compute, LLM API costs, and SaaS licenses within the technology budget ($62–159K Year 1, growing to $142–325K Year 3).

- Ensure the platform architecture supports future geographic expansion (beyond LA) and the robotics bridge thesis (every module built for human crews becomes the operating layer for future robotic deployment).
- Present technology progress and ROI to the board and potential PE investors.

Required Qualifications

- 8–15 years of experience in AI/ML product leadership or engineering leadership. Must have shipped production systems used by non-technical end users, not just research prototypes.
- Experience building operations platforms in physical-world industries: construction, logistics, manufacturing, field services, or similar. You understand that software for a construction site is different from software for an office.
- Proven ability to hire and lead engineering teams of 5–10 people. References from previous direct reports.
- Deep technical skills: system architecture, ML pipeline design, data engineering, and modern web/mobile development. You can review code, debug production issues, and make architectural decisions.
- Comfort with ambiguity. The construction industry has virtually no standardized data, no clean APIs, and no established AI playbook. You will be building from first principles.
- Strong communication skills: you can explain technical trade-offs to a construction CEO who has never written a line of code, and translate field requirements into engineering specifications.

Preferred Qualifications

- Direct experience in construction technology (Procore, Autodesk Construction, PlanGrid, OpenSpace, Buildots, Doxel, Alice Technologies).
- Experience with computer vision systems for physical-world inspection or quality control.
- Background in logistics AI (Flexport, Convoy, Project44) or manufacturing AI.
- Familiarity with affordable housing compliance: LIHTC, prevailing wage, AAHR portal.
- MBA or advanced degree in CS/ML combined with operational domain experience.

Compensation

$180–250K base salary plus equity participation in the AI Mission Control platform entity plus performance bonus tied to sprint delivery milestones. Loaded cost at 1.3x: $234–325K. The equity component is designed to align long-term incentives with the PE exit thesis.

Success Metrics (6-Month Gate)

- Engineering team fully hired (4+ positions) within 6 months of start date.
- Sprint 1 (Data Foundation) delivered on time: data warehouse operational, 80%+ field crew daily reporting, live project data model.
- Sprint 2 (Document Intelligence) delivered: RFI processing time reduced 50%+.
- Platform architecture documented, scalable, and ready for geographic replication by Month 18.
- Technology spend within 10% of budget.

Failure Indicators

- Engineering hires take more than 4 months per role—team build stalls.
- Sprint deliverables consistently miss timelines or fail to deliver measurable operational improvement.
- AI team builds tools that the field team refuses to use—technology is not grounded in construction reality.
- Architecture is overengineered for current scale—built for 1,000 projects when we run 8.

Where to Find This Person

- ConTech: Procore, Autodesk Construction, PlanGrid alumni, OpenSpace, Buildots, Doxel, Alice Technologies. Product or engineering leaders.
- Logistics AI: Flexport, Convoy, Project44 alumni who solved similar physical-world orchestration problems.
- Consultants-turned-builders: McKinsey/BCG/Bain construction or infrastructure practice alumni with technical depth.
- ConTech conferences: ENR FutureTech, Autodesk University Construction track, CIFE at Stanford.
- Hacker News (Who’s Hiring), Work at a Startup (YC), AngelList, Built In LA.

6. Process Engineer / Analyst

The Translator's analytical right hand.

	Details
Department	Technology / AI
Reports To	Head of AI Operations
Location	Los Angeles, CA (office + regular job site visits)
Employment Type	Full-time
Hire Timing	Month 4–5
Compensation	$85–115K base

About the Role

You are an industrial engineer for construction workflows. You are detail-obsessed, love spreadsheets and flowcharts, and can spend a full day shadowing a superintendent without losing focus. Working alongside the Construction-AI Translator, you will turn messy field observations into clean, structured documentation: process flow diagrams, RACI matrices, data flow maps, and time allocation analyses. Your output directly determines what gets built, in what order, and why. After the 12–18 month mapping phase, you will transition into either a product manager for the AI platform or an operations analyst within Mission Control.

Key Responsibilities

- Create detailed process flow diagrams (flowcharts and swim-lane diagrams) for all 16 functional areas across 4 phases of construction operations.
- Build and maintain RACI matrices for every documented process, identifying responsible, accountable, consulted, and informed parties.
- Map data flows: document where information originates, how it moves between people and systems, and where manual data re-entry creates risk and automation opportunity.
- Conduct time allocation analyses: break down hours per week by role into value-add time versus coordination overhead. Quantify the automation opportunity in dollar terms.
- Compile the Failure Mode Catalog: document what goes wrong, how often, and what it costs across all functional areas. Score by frequency and cost impact.
- Calculate AI Automation Scores for each process step across five dimensions (volume, repeatability, data availability, error cost, technical complexity). Produce the prioritized build roadmap.
- Shadow field operations with the Translator: ride-along interviews, tool inventories, handoff mapping.
- Maintain and organize the Process Library—the master repository of all documentation that feeds the engineering team.

Required Qualifications

- 2–5 years of experience in process engineering, industrial engineering, operations analysis, or systems engineering.
- Exceptional documentation and visualization skills: process flows, data models, decision trees. You can take a messy 2-hour observation and produce a clean, accurate diagram.

- Quantitative rigor: you measure everything. Time, cost, frequency, error rates. Your analyses have numbers, not adjectives.
- Proficiency with process documentation tools: Visio, Lucidchart, Miro, or similar. Advanced Excel/Sheets.
- Ability to observe and document field operations without disrupting them. You are a fly on the wall, not a consultant trying to change things.
- Bachelor’s degree in industrial engineering, systems engineering, operations management, or related field.

Preferred Qualifications

- Lean Six Sigma certification (Green Belt or higher).
- Experience in construction, logistics, manufacturing, or other physical-world operations.
- Background in operations analysis at Amazon, UPS, FedEx, or similar high-volume operations companies.
- Familiarity with SQL for data analysis.

Compensation

$85–115K base salary. Loaded cost at 1.3x: $111–150K. LA market rate for industrial/process engineers: $85–113K (Salary.com, Glassdoor). Standard benefits package.

Success Metrics (6-Month Gate)

- Process documentation for 8+ functional areas complete within 4 months of hire.
- Automation scoring complete for at least 5 functional areas with clear build priority rankings.
- Head of AI Ops confirms documentation quality is sufficient to begin engineering.
- Time allocation analysis identifies at least $200K/year in addressable coordination overhead across the PM/super team.

Where to Find This Person

- Industrial/systems engineering graduates: USC, Cal Poly, UCLA, Cal State Northridge.
- Lean/Six Sigma practitioners from manufacturing or logistics.
- Operations analysts from Amazon, UPS, FedEx, or similar high-volume operations.
- Construction management graduates with strong analytical orientation.

7. Full-Stack Engineer

Build software that works in a construction trailer at 6 AM.

	Details
Department	Technology / AI
Reports To	Head of AI Operations
Location	Los Angeles, CA (hybrid: office + periodic job site visits)
Employment Type	Full-time
Hire Timing	Month 5–6
Compensation	$135–185K base

About the Role

You will build the software that construction crews use every day: the data warehouse, the field mobile app, the Mission Control dashboard, and all integrations with existing accounting and project management tools. Your users are not Silicon Valley product managers—they are superintendents with dusty hands and cracked phone screens, working in bright sunlight, often with spotty connectivity. The mobile app needs to be dead simple: three taps and a photo, not a 15-field form. You must be pragmatic—the goal is working software on real projects within weeks, not elegant architecture that ships in 18 months.

Key Responsibilities

- Build and maintain the data warehouse (PostgreSQL/TimescaleDB) that stores all structured project data: schedules, costs, field reports, crew data, and compliance documentation.
- Develop the field mobile app (React Native) for daily structured reporting, geotagged photo capture, and offline-first operation with sync-when-connected. The app must work in areas with no cell signal and sync automatically when connectivity returns.
- Build the Mission Control dashboard (React web application) for PMs, Grady, and office staff: real-time project status across all dimensions (schedule, cost, quality, risk, compliance).
- Implement API integrations with existing tools: accounting software (Sage, QuickBooks, Yardi), PM tools (Procore if used), scheduling software (P6, MS Project), and subcontractor portals.
- Set up and maintain CI/CD pipeline, infrastructure-as-code (Terraform), containerized deployment (Docker/Kubernetes), and monitoring (Datadog).
- Collaborate with the AI/ML Engineer to serve ML models and integrate AI outputs (scheduling recommendations, document drafts, cost predictions) into user-facing interfaces.
- Optimize for the field: test all user-facing features under real construction conditions (bright sunlight, gloves, rain, low connectivity). Visit job sites regularly.
- Build auto-generated lender draw packages, certified payroll reports, and owner progress reports from live project data.

Required Qualifications

- 5–10 years of full-stack engineering experience. Strong generalist who can build a React dashboard, a React Native mobile app, and a Python backend.
- Production experience with: PostgreSQL or similar RDBMS, REST APIs, React/React Native, Python or Node.js backend, cloud infrastructure (AWS or GCP).
- Experience building for non-technical end users in field conditions. You have shipped software used by people who are not sitting at a desk.
- Experience with offline-first mobile architecture (local storage, background sync, conflict resolution).
- Infrastructure skills: CI/CD, Docker, Terraform or equivalent. You can deploy, monitor, and debug production systems.
- Pragmatic engineering judgment: you optimize for shipping speed and user adoption, not architectural purity.

Preferred Qualifications

- Experience at B2B vertical SaaS companies (construction, real estate, logistics, field services).
- Previous experience at a ConTech company: Procore, PlanGrid, Fieldwire, OpenSpace, or similar.
- Experience with data pipeline tools: Airflow, dbt, or similar.
- Familiarity with construction workflows (even basic understanding of how a building gets built).

Compensation

$135–185K base salary. Loaded cost at 1.3x: $176–241K. LA market rate for full-stack engineers: $109–197K 25th–75th percentile (Built In LA, Glassdoor). Standard benefits plus potential equity participation.

Success Metrics (6-Month Gate)

- Data warehouse operational and receiving live field data within 8 weeks of hire.
- Field mobile app MVP deployed to test crew within 12 weeks. App passes the ‘3-taps-and-a-photo’ usability test.
- At least 2 API integrations (accounting + PM tool) live within 16 weeks.
- System uptime >99.5% from launch.

Failure Indicators

- Field crews reject the mobile app—too complex, too slow, or crashes in low-connectivity areas.
- Architecture decisions prioritize elegance over speed to production.
- Integration work stalls due to poor documentation or lack of API access to existing tools.

Where to Find This Person

- Mid-career engineers from B2B vertical SaaS: construction, real estate, logistics, field services.
- ConTech startup engineers: Procore, PlanGrid, Fieldwire, OpenSpace.
- Hacker News (Who’s Hiring), Work at a Startup (YC), AngelList, Built In LA.

- Climate/impact job boards (construction decarbonization angle).

8. AI/ML Engineer

Build the intelligence layer — 80% accuracy in 6 weeks beats 95% in 6 months.

	Details
Department	Technology / AI
Reports To	Head of AI Operations
Location	Los Angeles, CA (hybrid)
Employment Type	Full-time (or senior contractor for initial 3–6 month engagement)
Hire Timing	Month 6–8
Compensation	$132–217K base

About the Role

You will build the intelligence layer of Mission Control: scheduling optimization models, document AI (RAG pipeline for RFIs and submittals), predictive cost models, and the early-stage computer vision system. You do not need to know construction on day one—the Translator and process documentation provide complete domain context. What you need is the ability to get an 80% accurate model into production in 6 weeks. We are not a research lab. We are a construction company that needs working AI on real projects, fast. Every model you build gets tested against reality within weeks: did the schedule prediction match what happened? Did the RFI draft save the PM time? Did the cost alert catch a real overrun?

Key Responsibilities

- Build the Document Intelligence module: RAG pipeline that retrieves relevant project documents (specs, plans, prior RFIs, submittals, code sections) and uses LLM APIs (Anthropic Claude, OpenAI) to draft RFI responses, route submittals, and benchmark change order pricing.
- Develop scheduling optimization models: constraint-based scheduling trained on LV Construction’s historical duration data. Predict trade sequencing, estimate activity durations, and generate 3-week lookaheads.
- Build predictive cost models: identify when burn rate diverges from physical progress, flag early warning signs of cost overruns, and generate daily cost-at-complete forecasts.
- Develop the initial computer vision training pipeline for the CV Specialist (Month 14–18). Establish labeling workflows, transfer learning architecture, and model evaluation frameworks.
- Implement risk prediction models: pattern matching against historical project data to identify early warning signs of delays, overruns, and quality issues.
- Manage MLflow for experiment tracking and model versioning. Maintain a clean, reproducible ML pipeline.
- Work with the Full-Stack Engineer to serve models in production and integrate AI outputs into user-facing interfaces.
- Optimize for practical accuracy over theoretical perfection. Every model ships with a clear accuracy metric and a plan for improvement based on production data.

Required Qualifications

- 4–10 years of applied ML engineering experience. Must have shipped ML models to production in business-critical applications (not just research or Kaggle).
- Strong NLP and LLM application skills: RAG pipelines, prompt engineering, document retrieval, embedding models. You have built production systems using commercial LLM APIs.
- Experience with PyTorch or TensorFlow. Proficiency with scikit-learn and/or XGBoost for tabular prediction models.
- Solid software engineering fundamentals: Python, APIs, data pipelines, version control. You write production code, not just notebooks.
- Experience with MLflow or similar experiment tracking tools.
- Practical orientation: you optimize for time-to-production and real-world accuracy, not benchmark scores.

Preferred Qualifications

- Experience with computer vision (object detection, image classification) even if not construction-specific.
- Background in physical-world AI: logistics, manufacturing, robotics, autonomous vehicles, or infrastructure.
- Experience with constraint-based optimization or operations research.
- Familiarity with construction or real estate (helpful but not required—the Translator provides domain context).

Compensation

$132–217K base salary. Loaded cost at 1.3x: $172–282K. LA market rate for AI/ML engineers: $132–217K with average $168K (Glassdoor, Built In LA). Equity participation possible. Alternative: consider a senior contractor (3–6 month engagement at $150–200/hr) to prove the use case before full-time commitment.

Success Metrics (6-Month Gate)

- Document Intelligence MVP (RFI drafting) deployed on 1–2 projects within 10 weeks. PM feedback confirms time savings of 50%+ per RFI.
- Scheduling model v1 generates 3-week lookaheads within 10% accuracy of actuals on pilot projects by Month 12.
- At least 2 ML models in production and generating measurable operational value within 6 months of hire.
- Clean ML pipeline with reproducible training, versioned models, and production monitoring.

Failure Indicators

- Months spent pursuing accuracy improvements with no production deployment.
- Models built on generic data rather than LV Construction’s own project history.
- AI outputs that PMs and supers ignore because they don’t match field reality.

Where to Find This Person

- Applied ML engineers from physical-world AI: logistics (Flexport, Convoy), manufacturing, robotics, autonomous vehicles.
- NLP/LLM engineers with RAG system experience at SaaS companies.
- Data scientists from construction-adjacent industries (real estate, insurance, infrastructure).
- ML engineering job boards: MLOps Community, AI/ML Jobs, Hacker News.

9. Data Engineer

Phase 2 hire — scale the data infrastructure as project volume grows.

	Details
Department	Technology / AI
Reports To	Head of AI Operations
Location	Los Angeles, CA (hybrid)
Employment Type	Full-time
Hire Timing	Month 12–14
Compensation	$125–175K base

About the Role

By the time you join, LV Construction will have 8–12 active projects generating structured data daily: field reports, photos, schedule updates, cost data, inspection results, and compliance documentation. The data warehouse built by the Full-Stack Engineer needs to scale, and the ML models need clean, reliable data pipelines. Your job is to take data infrastructure from ‘it works’ to ‘it works reliably at scale.’ You free the Full-Stack Engineer to focus on product features by owning everything from raw data ingestion to the clean, queryable datasets that feed the dashboard and ML models.

Key Responsibilities

- Build and maintain ETL/ELT pipelines that ingest data from field mobile apps, accounting software, PM tools, and external sources into the data warehouse.
- Implement data quality monitoring: automated checks for missing data, anomalies, schema violations, and pipeline failures. Alert on issues before they affect downstream consumers.
- Optimize data warehouse performance: query optimization, partitioning, indexing, and storage management for growing data volumes (particularly photo storage at 2–5 TB/year).
- Build and maintain API integrations with accounting software (Sage, QuickBooks, Yardi), PM tools (Procore), and scheduling software (P6, MS Project).
- Create and maintain data models that serve both the Mission Control dashboard (real-time queries) and ML models (batch training datasets).
- Implement data governance: access controls, audit logging, retention policies, and backup procedures.
- Support the AI/ML Engineer with feature engineering and training dataset preparation.
- Document all data pipelines, schemas, and integration points.

Required Qualifications

- 3–7 years of data engineering experience. Production experience building and maintaining data pipelines at scale.
- Proficiency with SQL and at least one data pipeline framework: Airflow, dbt, Dagster, Prefect, or similar.

- Strong experience with PostgreSQL or similar RDBMS. Familiarity with time-series databases (TimescaleDB, InfluxDB) a plus.
- Cloud infrastructure experience: AWS (S3, RDS, Lambda, Glue) or GCP equivalent.
- Python proficiency for data processing, API integration, and scripting.
- Experience with data quality monitoring and alerting frameworks.

Preferred Qualifications

- Experience with construction, real estate, or field-services data.
- Familiarity with image/document storage and retrieval at scale (S3, CDN configuration).
- Experience with streaming data (Kafka, Kinesis) for real-time dashboard updates.
- Terraform or similar infrastructure-as-code experience.

Compensation

$125–175K base salary. Loaded cost at 1.3x: $163–228K. Standard benefits plus potential equity participation.

Success Metrics (6-Month Gate)

- Data pipeline reliability >99.5%—no missed daily ingestion within first 90 days.
- Query performance improvements: dashboard load times reduced by 50%+ on key queries.
- Full-Stack Engineer reports significant time freed for product feature work.
- Data quality monitoring catches issues before they affect operational reports or ML models.

Where to Find This Person

- Data engineers from B2B SaaS companies with physical-world data: logistics, manufacturing, real estate, field services.
- Infrastructure engineers who want to move closer to the data/ML side.
- Built In LA, Hacker News, Data Engineering Weekly job board.

10. Computer Vision Specialist

Phase 2 hire — teach machines to see what superintendents see.

	Details
Department	Technology / AI
Reports To	Head of AI Operations
Location	Los Angeles, CA (hybrid + regular job site visits for data collection)
Employment Type	Full-time (or start as contractor, convert to FTE)
Hire Timing	Month 14–18
Compensation	$150–210K base

About the Role

By the time you join, LV Construction will have 12—18 months of structured, geotagged photo data from active construction projects: thousands of images of framing, MEP rough-in, drywall, and finish work across multiple buildings and unit types. Your job is to train computer vision models that detect installation defects, compare as-built conditions to plans, and auto-generate punch lists—the things an experienced superintendent catches with their eyes during a daily walkthrough. This is the most technically ambitious module in Mission Control. You will build the system that eventually enables every photo taken on a construction site to be an automated quality control checkpoint.

Key Responsibilities

- Design and implement the CV training pipeline: data labeling workflows, model architecture selection, transfer learning from pre-trained construction/inspection models, and evaluation frameworks.
- Train custom defect detection models for construction-specific categories: missing fire blocking, incorrect framing spacing, plumbing violations, electrical deficiencies, finish defects, and deviation from approved plans.
- Build and curate the labeled training dataset: coordinate with field crews and the Field Tech Liaison to capture structured photos with consistent quality. Target: 3,000–5,000 labeled images per defect category.
- Implement as-built comparison: compare field photos against plan drawings to identify deviations.
- Build the automated punch list pipeline: CV model output → defect location (mapped to specific units/areas) → sub attribution → severity classification → punch list item with photo evidence.
- Pilot the CV system on 1–2 projects before full deployment. Measure accuracy against superintendent inspection findings.
- Optimize model inference for cloud GPU deployment (not on-device). Manage GPU compute costs for both training and production inference.
- Continuously improve model accuracy based on production feedback: false positives flagged by supers, missed defects caught by manual inspection.

Required Qualifications

- 4–10 years of computer vision experience with production deployment (not just research papers).
- Strong experience with PyTorch. Expertise in object detection (YOLO, Faster R-CNN, or similar), image classification, and semantic segmentation.
- Experience with transfer learning and fine-tuning pre-trained models on domain-specific data.
- Hands-on experience with data labeling pipelines and tools (Label Studio, CVAT, Scale AI, or similar).
- Production ML engineering skills: model serving, inference optimization, monitoring, and continuous improvement.
- Comfort with imperfect, real-world data. Construction photos are taken by non-photographers in varying lighting, angles, and conditions. Your models must be robust to this noise.

Preferred Qualifications

- Experience with inspection, quality control, or defect detection in any industry (manufacturing, automotive, infrastructure).
- Background in construction, architecture, or building science (even basic familiarity helps).
- Experience with 3D reconstruction, point cloud analysis, or spatial understanding from images.
- Published work or open-source contributions in applied computer vision.

Compensation

$150–210K base salary. Loaded cost at 1.3x: $195–273K. Can start as a contractor ($125–175/hr) for the first 3–6 months before converting to full-time, reducing risk on both sides. Equity participation possible.

Success Metrics (6-Month Gate)

- Training pipeline operational with first model trained within 8 weeks of hire.
- Defect detection accuracy >75% on the top 3 defect categories within 6 months (measured against superintendent inspection findings).
- Automated punch lists generated for pilot projects within 24 hours of photo capture.
- Rework identified same-day rather than at final walkthrough on pilot projects.

Failure Indicators

- Months spent on model architecture without producing a usable prototype.
- Training data quality too low due to poor coordination with field teams on photo capture standards.
- Models produce too many false positives, causing superintendents to ignore the system entirely.

Where to Find This Person

- CV engineers from construction-adjacent CV companies: Buildots, Doxel, OpenSpace, Disperse, Versatile.

- Applied CV engineers from manufacturing inspection, automotive quality, or infrastructure monitoring.
- Computer science/CV graduate programs: Stanford, CMU, MIT, Georgia Tech, UCLA.
- Kaggle competition winners with object detection expertise.
- NeurIPS, CVPR, ECCV conference attendee networks.
